(Currently Amended) An energy device comprising a winding body in which a 1. band-shaped laminate having a flexible clongated substrate, a negative collector, a solid electrolyte, a positive active material, and a positive collector in this order is wound in a plate shape with the flexible elongated substrate placed inside,

wherein a cross-sectional shape of the winding body perpendicular to a winding axis includes portions at opposing ends of the cross-sectional shape with small radiuses of curvature and portions between the opposing ends of the cross-sectional shape with large radiuses of curvature,

wherein the flexible elongated substrate is made of an insulating material.

- (Cancelled) 2.
- (Original) The energy device according to claim 1, further comprising a negative 3. active material between the negative collector and the solid electrolyte.
- (Original) The energy device according to claim 3, wherein a thickness of the 4. negative active material is smaller than that of the positive active material.
- (Original) The energy device according to claim 1, wherein a minimum radius of 5. an outer surface of the flexible elongated substrate is in a range of 5 times to 100 times a thickness of the band-shaped laminate excluding the flexible elongated substrate.
- 6-29. (Canceled)

Application Serial No: 10/815,151 Responsive to the Office Action mailed on: June 12, 2008

30. (Previously Presented) The energy device according to claim 1, wherein the ratio of the size in a horizontal direction to the size in a vertical direction for the plate shape is at least 5.
